

SUBSTITUTE ABSTRACT

A sports shoe with an impact absorber system has an impact absorber set being located in the heel or in two or three regions of the shoe, providing variable shock absorption to a user's foot. Each impact absorber set is formed of tubular elements of elliptical, circular or compound cross-section, the absorber set being closed laterally by walls which provide stability to the absorber set, the shoe and eventually to the user. The absorber sets can be installed partially or over the entire sports shoe.
